

Blue Ridge Models US Navy 1/350 scale 20mm single or double Oerlikon's are 3D printed using a slightly flexible resin material. This product is one of the best 3D printed detail sets I have tested and I am presently using on my Tamiya Missouri build. The guns are easy to remove and clean up and they have excellent detail. Each set has 24 guns and it is priced at \$19.95.

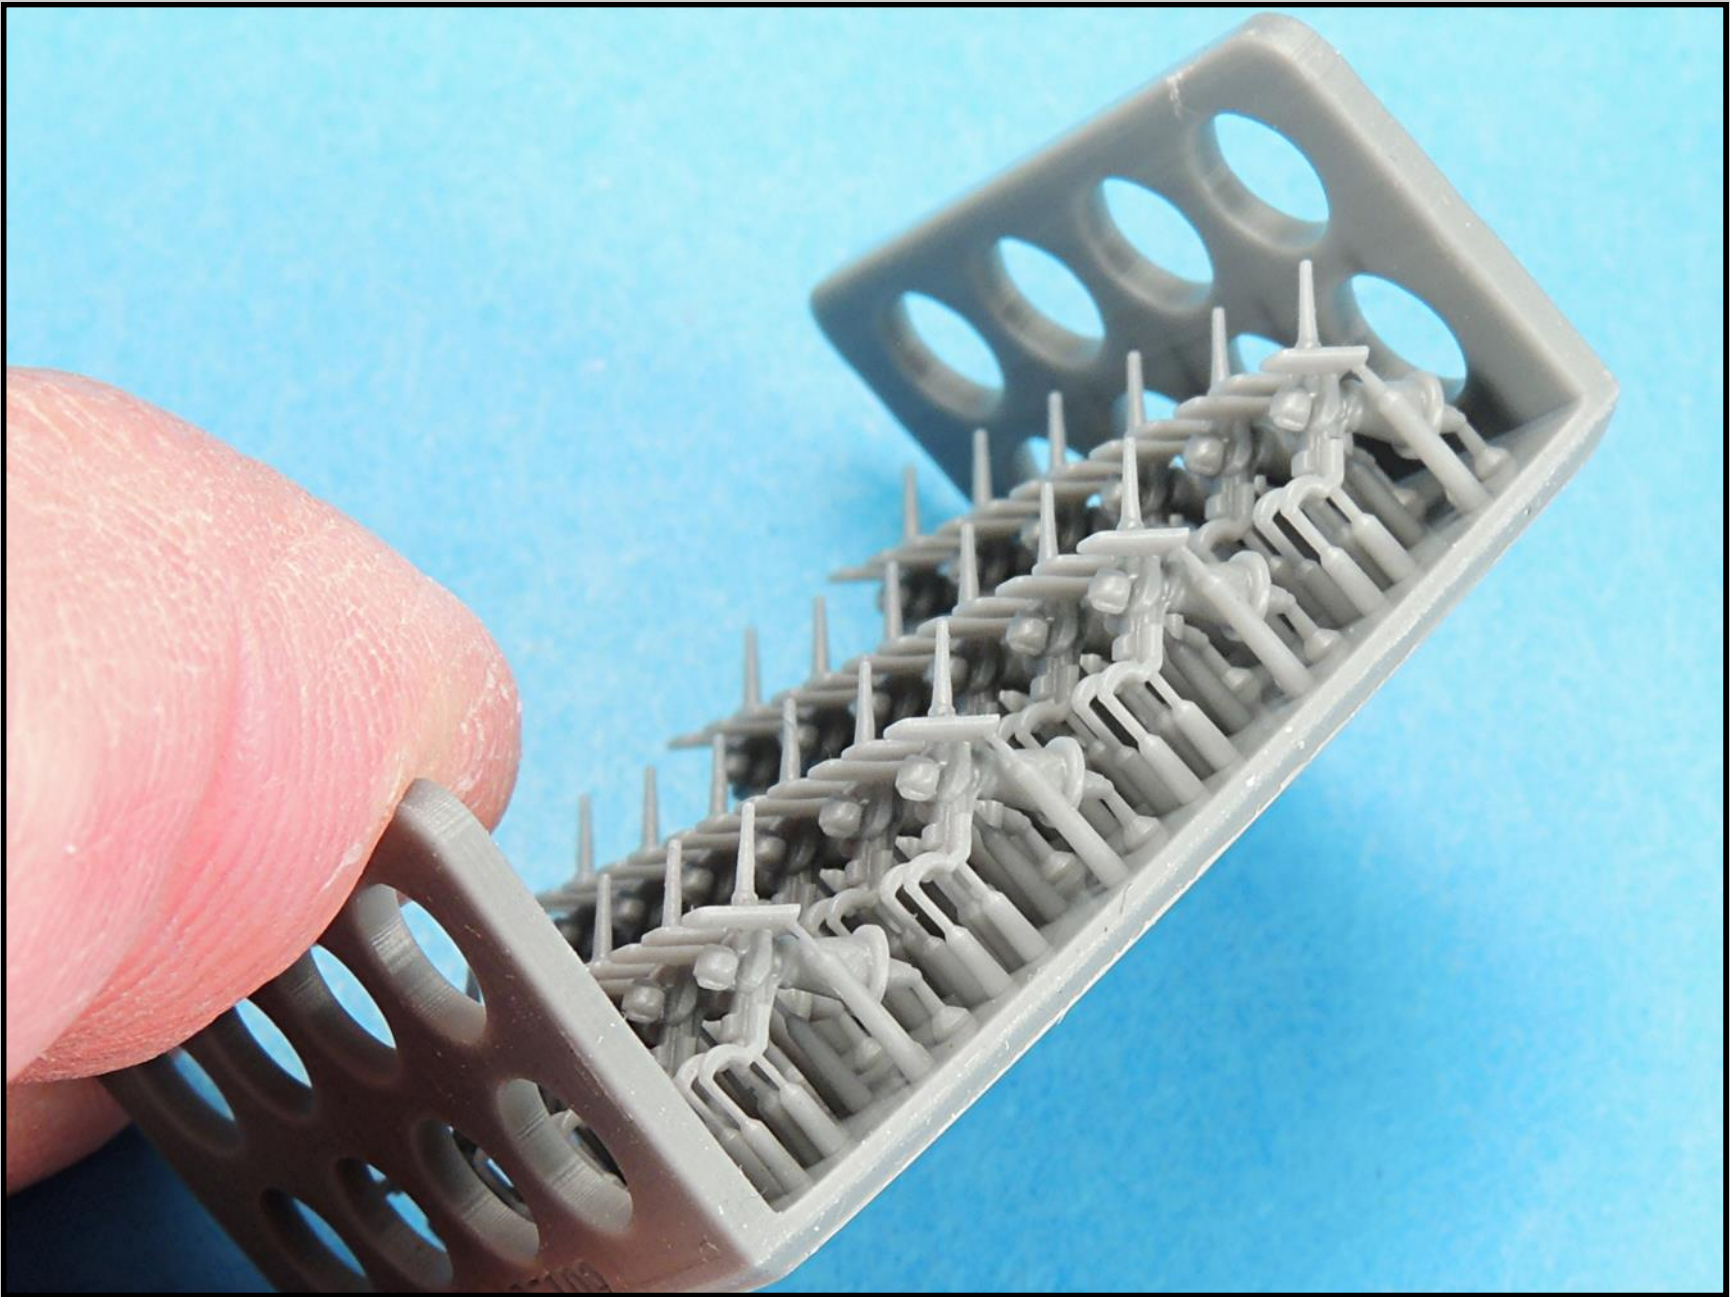

The packaging is also top quality and the tree strips that hold the guns in place on the base are less than .015 inches in diameter and as they connect to each part in different locations their diameter is even smaller.

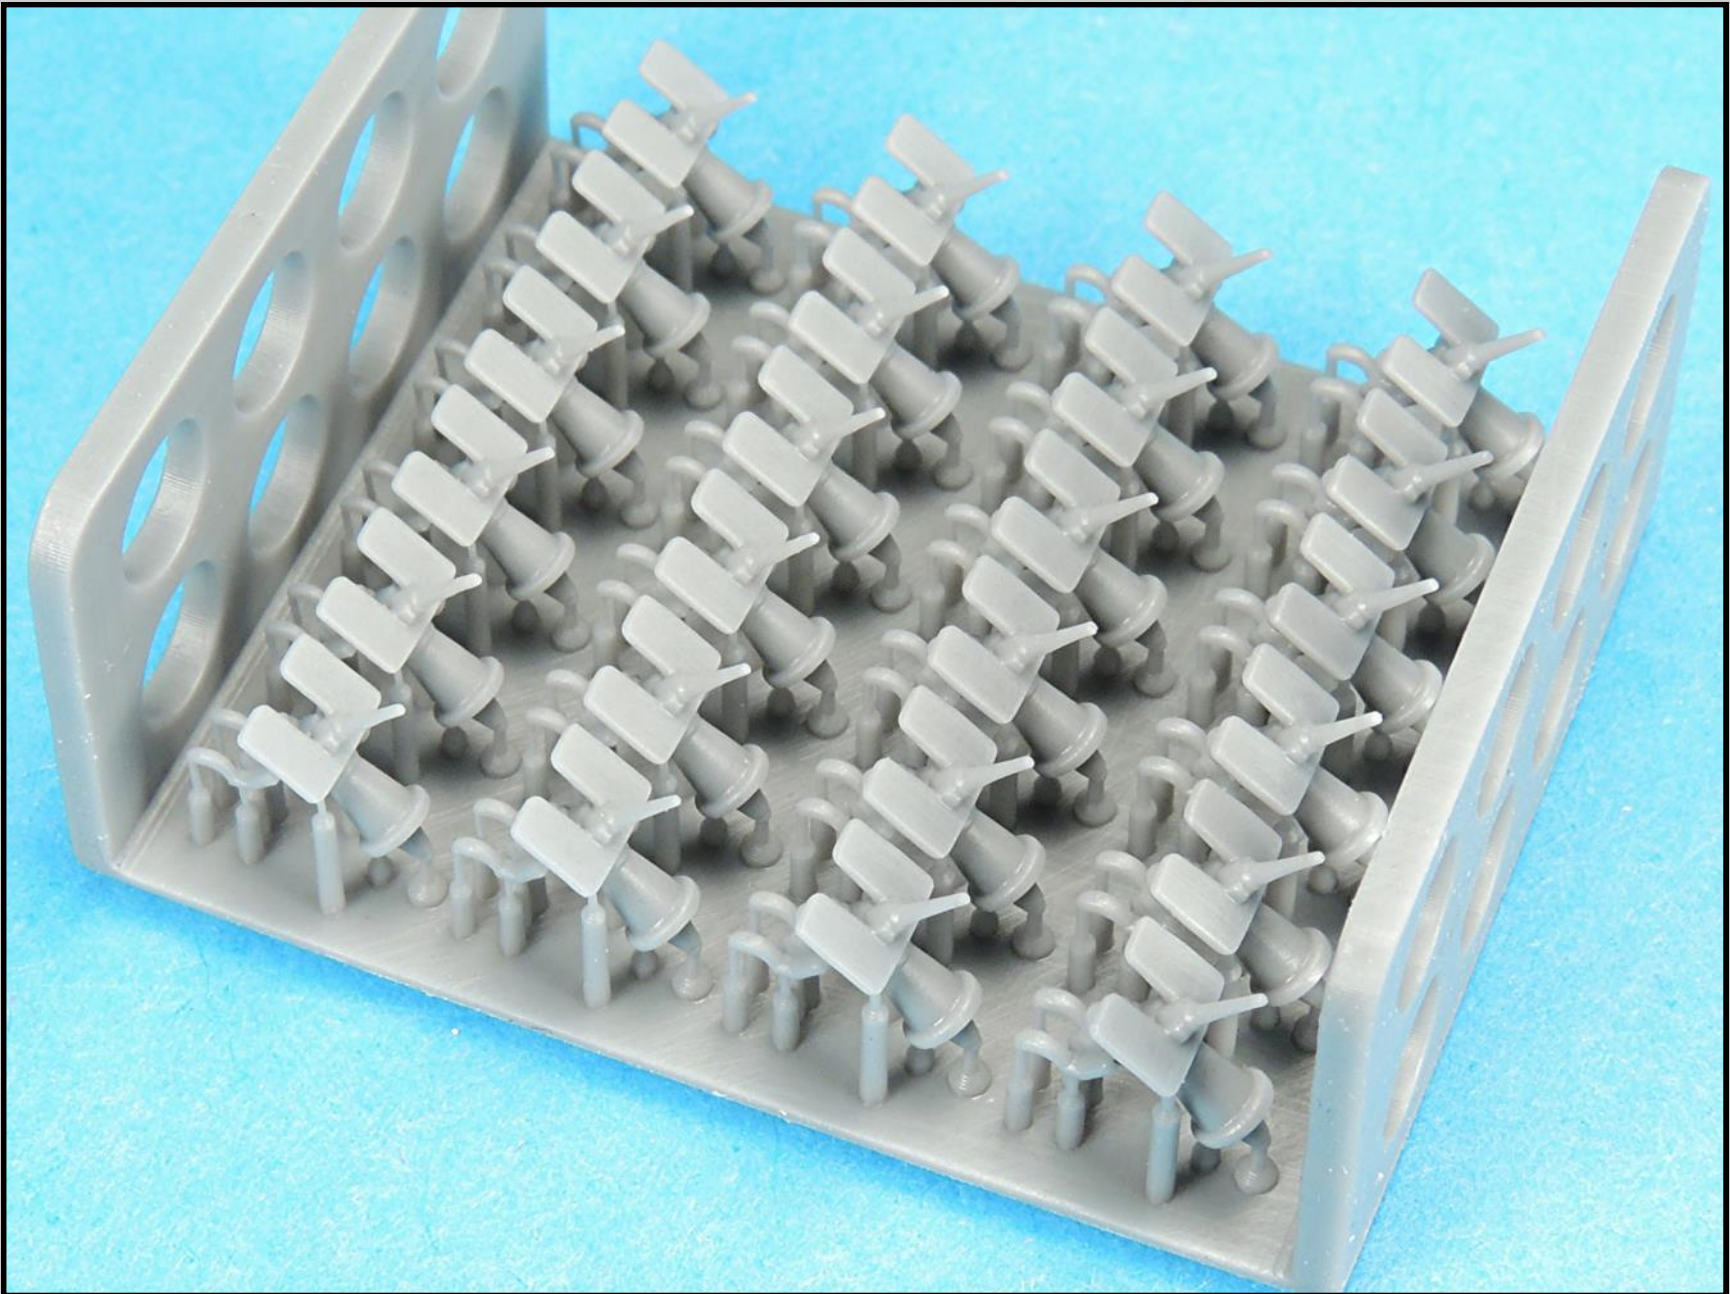

The gun barrels and shields are beautifully printed with no residue around the tips or the edges.

The adjusting wheels are spoked and the gun bases are very clean with no resin residue. Note how the tree connectors between the part and the base get smaller in diameter.

The guns have correctly shaped shoulder supports and the guns also have their magazines.

Here again note how tiny the diameters are on the tree attachment points on each gun are. This makes it very easy to remove any remaining stubs with the tip of a number 11 X-Acto blade.
